

Define Problem Statements

Date	04 October 2026
Team ID	POCKETSMART-TEAM
Project Name	PocketSmart AI – Smart Budget & Recommendation Assistant using Gemini Models
Maximum Marks	3 Marks

Step 1: Problem Identification

S.No	Problem Statement	Affected Users	Impact
1	Large one-time purchases such as home furnishing, a party or jewelry are hard to split sensibly across categories within a fixed budget.	Households and individuals planning a purchase or event	Overspending on one category and shortfalls in others
2	Generic budgeting advice is rarely expressed in INR or tied to products and platforms available in India.	Indian shoppers	Advice is difficult to act on
3	After a plan is made, shoppers must search several sites (Amazon, Flipkart, Swiggy, BookMyShow and others) item by item.	Users turning a plan into purchases	Time lost and plans abandoned
4	Earlier plans are easily lost, so comparing or revisiting them means starting again.	Returning users	Repeated effort

Step 2: Selected Problem

How can a web application turn a total budget and a few simple details into an itemised, INR-based plan for a home, a party or a jewelry purchase, with direct links to shop for each item, even when the AI service is unavailable?

Step 3: Project Objective

PocketSmart AI collects the budget and requirements through simple forms, asks Gemini for a structured breakdown with estimated prices, attaches shopping search links for each item, falls back to a rule-based estimate if Gemini cannot respond, and saves every result in a per-user history that can be reopened.

Team Responsibility

Madhumitha S frames the system and access control; Chitabatini Tanushree frames the user experience; Srija Venkataraman frames the AI solution; Praveenkanth M frames validation, reliability and testing; Karthikha PR frames documentation and the demonstration.
