## Project Pitch

---

PocketSmart AI is an AI-powered budget assistant that turns a total budget into an itemised plan in INR for a home, a party or a jewelry purchase, adds shopping links for every item, and still gives a sensible estimate when the AI service is unavailable.

## 60-Second Explanation

---

1. A user registers and signs in.
2. They pick a planner and enter a budget and a few details (jewelry also accepts an outfit photo).
3. FastAPI validates the request and sends a structured prompt to Gemini.
4. Gemini returns a category-wise plan with estimated prices; the app adds shopping links.
5. If Gemini fails, a labelled fallback estimate is shown instead.
6. The plan is saved to the user's history and can be reopened later.

## Speaker Allocation

---

- Madhumitha S: problem, architecture and backend workflow.
- Chitabatini Tanushree: pages, planner forms and user experience.
- Srija Venkataraman: Gemini integration, prompts, model fallback and shopping links.
- Praveenkanth M: validation, fallback behaviour and tests.
- Karthikha PR: documentation, demo preparation and future improvements.
