

Scalability & Future Plan

Date	04 October 2026
Team ID	POCKETSMART-TEAM
Project Name	PocketSmart AI – Smart Budget & Recommendation Assistant using Gemini Models
Maximum Marks	1 Marks

Current System Limitations

S.No	Limitation	Impact	Priority to Address
1	Users, sessions and history are stored in memory.	All data is lost on restart and cannot be shared across multiple server processes.	High
2	AI quality, latency and free-tier quotas depend on the Gemini service.	Some requests will use the fallback estimate.	High
3	CORS allows all origins and the secret key has a development default.	Must be tightened before any public deployment.	High
4	Prices are AI estimates, not live prices.	Users must confirm prices on the shopping sites.	Medium
5	The application is run locally rather than as a hosted service.	Public multi-user access needs deployment hardening.	Medium

Future Enhancements

- A persistent database (for example PostgreSQL or MongoDB) for users and history.
- Cloud deployment over HTTPS with a required SECRET_KEY and restricted CORS.
- Live price lookups and product images from retailers.
- More planners, such as travel and student kits.
- Saving, comparing and exporting plans.
- Multi-currency support and user-defined category priorities.
- Rate limiting on sign-in and planner endpoints.
